

Western Excelsior – Sixteen Feet Closer to the Future

Western Excelsior is dedicated to providing its customers with quality, value and service within a full line of erosion and sediment control products. Manufactured entirely in Southwestern Colorado, Western Excelsior's product line includes straw, excelsior, coconut, synthetic and blended matrices to meet a range of performance requirements. Western Excelsior designs, manufactures and evaluates each of its products to provide engineered environmental stewardship.

With industry demand growing and Western Excelsior's success through a dedicated program of research and development, increased production was identified as essential for future success. Increased production capacity and the ability to dedicate an entire production line to research and development will be provided by the addition of a sixteen foot wide RECP production machine.

The new RECP production machine will be supplied by MST of Germany and is capable of producing blankets in widths of four to sixteen feet. The sixteen foot width is the largest in the industry, minimizes seams and reduces installation costs. By increasing production, Western Excelsior will be able to reduce delivery lead time and allow experienced staff to dedicate one existing production line to develop new concepts and manufacturing techniques

Western Excelsior has spent the past 16 years growing to meet the demands of distributors solving erosion and sedimentation problems and is now actively helping contractors comply with NPDES Phase II regulations. Western Excelsior is committed to servicing their distributors by providing flexibility in product availability and delivery and a continuously improving product support program.

Maybe it is time you reconsidered your Erosion Control Supplier?
